

**EQUIPMENT & SERVICES FOCUS**

■ A range of destructive seam analysis equipment has been launched by Italy's Parmacontrols following its acquisition of LaboScientifica.

Called LaboMetrology, the equipment range covers cans for food, beverages and aerosols and includes optics that have been improved to be less sensitive to external light interference, ensuring high image definition and good measurement accuracy. The system is equipped with Windows and iOS compatible software, which is said to be easier to use when producing reports and for database management.

Also available from Parmacontrols is a bead depth and height gauge for three-piece food cans which provides both average and detailed measurements equivalent to those provided by a profilometer.
